Facts

When measuring with an electrical resistance meter a current is flowing into the wood piece. This current is actual ionizing the material that the wood contains of (Cell membrane, water etc.)

As an result the resistance fluctuates giving a fluctuation and drift of Moisture Content readout. On higher Moisture Content levels the accuracy of the measurement depends on how well the user is to make an estimate of average the varying MC value.

With the new polarization feature the ionizing is avoided so that the MC-460 provides fast and stable measurements to the User.
